

INSTRUCTIONS FOR USE

Adjusting the field of view

The distance between the eyes varies from one person to the next. To achieve perfect alignment of the eyes and the lens openings, hold the binoculars in the normal viewing position and move the two barrels either apart or closer to each other until you have a single, clear field of view.

Focusing

1. Set the right eyepiece (A) to zero and look at a distant object.
2. Cover the right front lens with your hand and rotate the focusing wheel (B) until the image in the left eyepiece appears sharp. Keep both eyes open while you make this adjustment.
3. Now cover the left front lens with your hand and rotate the right eyepiece until the image is sharp.
4. The binoculars have now been adjusted to your eyes. Note the dioptre reading of the right eyepiece for future reference.

Rolling down the eyecups

If you wear glasses, roll down the eyecups (C); this will reduce the distance between the eyepiece and the eyes, providing an improved field of view.

Tripod

For some models you have the possibility to use a tripod. Remove the protection cap (D) and screw on the binoculars to the tripod.

Maintenance

1. Use a soft lens brush or a soft, lint-free cloth to clean the binoculars.
2. If you use a cleaning agent, never apply the liquid to any of the glass surface, but sprinkle it on the cloth.
3. Protect the instrument from damp, extreme temperatures, vibration or shock.
4. In case of complaint contact the original point of purchase. No guarantee if the instrument is handled or opened improperly.

Attention: Do not look directly into the sun neither with these binoculars nor with naked eye!
